

PRODUCT REQUIREMENTS DOCUMENT

# AI Business Opportunity Intelligence Platform

*A structured and investor-grade PRD derived from the original startup proposal and product concept.*

|                 |                                                                           |
|-----------------|---------------------------------------------------------------------------|
| Document status | Draft v1.0                                                                |
| Prepared for    | Founders, product team, engineering, data science, investors, incubators  |
| Prepared date   | 4 July 2026                                                               |
| Source basis    | AI Business Opportunity Intelligence Platform proposal (.docx)            |
| Primary outcome | Defines product scope, requirements, delivery phases, and success metrics |

## Table of Contents

If needed, Word can generate an automatic table of contents from the heading styles in this document.

- 1. 1. Product Overview
- 2. 2. Problem Statement and Opportunity
- 3. 3. Product Vision, Goals, and Non-Goals
- 4. 4. Target Users and Personas
- 5. 5. Use Cases and User Journeys
- 6. 6. Scope and Product Features
- 7. 7. Functional Requirements
- 8. 8. Non-Functional Requirements
- 9. 9. Data, AI, and Integration Requirements
- 10. 10. Analytics and Success Metrics
- 11. 11. Risks, Dependencies, and Assumptions
- 12. 12. Roadmap and Delivery Plan
- 13. 13. Acceptance Criteria
- 14. 14. Appendices

## 1. Product Overview

*This PRD reframes the original proposal into an execution-oriented product definition for design, engineering, data, and go-to-market alignment.*

| Field            | Definition                                                                   |
|------------------|------------------------------------------------------------------------------|
| Product name     | AI Business Opportunity Intelligence Platform                                |
| Product category | AI SaaS / Location Intelligence / Business Decision Support                  |
| Primary promise  | Help users identify the most promising business opportunities for a specific |

|                              |                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------|
|                              | location before investing capital.                                                                                         |
| <b>Core value</b>            | Converts fragmented market, location, demographic, and competitive data into ranked, explainable business recommendations. |
| <b>Primary users</b>         | Entrepreneurs, franchise buyers, SME owners, expansion teams, investors, consultants, and lenders.                         |
| <b>Initial release focus</b> | MVP for location analysis, competitor mapping, opportunity scoring, AI summary, and downloadable reports.                  |

## 2. Problem Statement and Opportunity

Entrepreneurs and operators frequently make high-cost expansion and launch decisions with incomplete evidence. Existing tools expose only partial views such as maps, reviews, property listings, or demographic snapshots. None of these tools independently answer the strategic question: what business is most likely to succeed in this location, with this budget, at this time?

The platform opportunity lies in synthesizing location intelligence, business density data, demographic signals, investment assumptions, and predictive models into one explainable decision layer. This creates a differentiated product that can improve market selection, reduce launch risk, and shorten time-to-decision.

| Dimension                  | Current State                                  | Desired Future State                                                     |
|----------------------------|------------------------------------------------|--------------------------------------------------------------------------|
| <b>Research workflow</b>   | Manual and fragmented across multiple websites | Unified workflow with structured inputs and AI-generated recommendations |
| <b>Decision confidence</b> | Low to moderate; heavily assumption-driven     | Higher confidence supported by scoring, rationale, and benchmark data    |
| <b>Time to insight</b>     | Days or weeks of manual review                 | Minutes for first-pass opportunity assessment                            |
| <b>Scenario analysis</b>   | Ad hoc and spreadsheet-heavy                   | Embedded investment, demand, and risk simulation                         |

## 3. Product Vision, Goals, and Non-Goals

| Type           | Statement                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------|
| <b>Vision</b>  | Become the leading AI platform for business opportunity discovery and location-based market intelligence. |
| <b>Mission</b> | Enable every entrepreneur and operator to make evidence-based investment decisions before spending money. |

### 3.1 Product Goals

- Identify business opportunities with the strongest fit for a selected location and budget.
- Explain why a recommendation is attractive using transparent market, competition, and demographic signals.
- Estimate investment range, revenue potential, break-even horizon, and principal risks.
- Reduce manual research effort and accelerate pre-investment decision-making.
- Create a scalable subscription platform that can expand into enterprise workflows and APIs.

### 3.2 Non-Goals for MVP

- Not a full ERP, accounting suite, or daily business operations platform.
- Not a guaranteed predictor of business success or legally binding investment advice.
- Not a replacement for all primary research, due diligence, or commercial real-estate negotiation.
- Not a marketplace for property transactions in the MVP release.

## 4. Target Users and Personas

| Persona                               | Profile                                               | Primary Jobs-to-be-Done                                       | Pain Points                                                 |
|---------------------------------------|-------------------------------------------------------|---------------------------------------------------------------|-------------------------------------------------------------|
| <b>Founding Entrepreneur</b>          | First-time founder exploring where and what to launch | Validate business idea, shortlist area, estimate capital need | Limited research time, low data confidence, fear of failure |
| <b>Franchise / Multi-unit Buyer</b>   | Operator evaluating several neighborhoods or cities   | Compare territories, assess competition, justify expansion    | Inconsistent data quality, slow manual analysis             |
| <b>SME Expansion Manager</b>          | Existing business seeking branch rollout              | Rank expansion locations, model upside, track market gaps     | Needs repeatable process across many locations              |
| <b>Investor / Lender / Consultant</b> | Advisory or underwriting stakeholder                  | Review opportunity strength, risk, and assumptions quickly    | Needs structured and defensible evidence                    |

## 5. Use Cases and User Journeys

15. A founder enters a city, neighborhood, budget range, and preferred sectors to receive ranked business opportunities.
16. A franchise operator compares three possible sites and reviews demand, competition, and payback estimates side by side.
17. An SME expansion manager uploads internal assumptions and receives a branch rollout shortlist with risk flags.
18. A consultant exports a branded opportunity report to support a client recommendation.
19. A lender reviews a proposed business concept, supporting rationale, and sensitivity summary before credit evaluation.

## 5.1 Core User Journey

| Step | User Action                                                   | System Response                                                                     |
|------|---------------------------------------------------------------|-------------------------------------------------------------------------------------|
| 1    | Enter location, budget, business preferences, and constraints | Validate input and initialize area analysis                                         |
| 2    | Request opportunity analysis                                  | Aggregate data sources and compute area profile, competition, and demand indicators |
| 3    | Review ranked opportunities                                   | Display scores, rationale, risk, investment range, and comparison views             |
| 4    | Drill into one opportunity                                    | Show deeper competitor insights, gap analysis, demand curve, and financial forecast |
| 5    | Export or share findings                                      | Generate downloadable report and save analysis history                              |

## 6. Scope and Product Features

| Feature Area                 | MVP                                                                              | Post-MVP / Future                                                       |
|------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Location intelligence</b> | Area scoring based on demographic, mobility, infrastructure, and amenity signals | Advanced footfall estimation, satellite imagery, custom trade areas     |
| <b>Competitor analysis</b>   | Competitor count, category density, clustering, ratings and reviews summary      | Pricing scrape, visit pattern estimation, dynamic competitor monitoring |
| <b>Market gap detection</b>  | Underserved category detection and fit ranking                                   | Predictive white-space alerts and cross-city comparison                 |
| <b>Demand prediction</b>     | Baseline demand estimates with confidence bands                                  | Seasonal and scenario-driven forecasts by business type                 |
| <b>Financial forecasting</b> | Capital range, revenue estimate, break-even view                                 | Multi-scenario simulator and financing sensitivity                      |
| <b>AI advisor</b>            | Natural-language explanation and recommendation summary                          | Action plans, hiring plan, pricing strategy, launch checklist           |
| <b>Reporting</b>             | Export summary report and save analysis                                          | Team collaboration, branded reports, API outputs                        |

## 7. Functional Requirements

*Requirements are organized by capability and are written to support engineering delivery and test planning.*

| ID           | Capability          | Requirement                                                               |
|--------------|---------------------|---------------------------------------------------------------------------|
| <b>FR-01</b> | User Input & Search | The system shall allow users to enter a location, budget range, preferred |

|              |                             |                                                                                                                                        |
|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
|              |                             | business categories, and strategic constraints.                                                                                        |
| <b>FR-02</b> | Geocoding & Area Definition | The system shall normalize user-entered locations into coordinates, boundaries, and analysis zones.                                    |
| <b>FR-03</b> | Area Scoring                | The system shall calculate a location attractiveness score using demographic, infrastructure, mobility, and amenity signals.           |
| <b>FR-04</b> | Competitor Mapping          | The system shall identify existing businesses in relevant categories and visualize density and clustering.                             |
| <b>FR-05</b> | Gap Detection               | The system shall detect underserved or missing business categories for the selected area.                                              |
| <b>FR-06</b> | Demand Prediction           | The system shall generate demand estimates and confidence ranges for shortlisted business concepts.                                    |
| <b>FR-07</b> | Opportunity Ranking         | The system shall rank business opportunities using weighted logic across demand, competition, fit, growth, and investment factors.     |
| <b>FR-08</b> | Explainable Recommendations | The system shall provide human-readable rationale explaining each recommendation and score component.                                  |
| <b>FR-09</b> | Financial Forecast          | The system shall estimate startup investment, revenue range, operating cost range, payback horizon, and break-even point.              |
| <b>FR-10</b> | Risk Scoring                | The system shall produce overall and component-level risk scores covering competition, demand, infrastructure, and financial exposure. |
| <b>FR-11</b> | Comparison Workspace        | The system shall allow users to compare multiple locations or opportunities side by side.                                              |
| <b>FR-12</b> | AI Copilot                  | The system shall support conversational queries such as 'best business under this budget' or 'why is this area risky'.                 |
| <b>FR-13</b> | Report Export               | The system shall generate                                                                                                              |

|              |                     |                                                                                                                      |
|--------------|---------------------|----------------------------------------------------------------------------------------------------------------------|
|              |                     | downloadable reports summarizing opportunity ranking, rationale, and assumptions.                                    |
| <b>FR-14</b> | Saved Analyses      | The system shall allow authenticated users to save, reopen, and manage prior analyses.                               |
| <b>FR-15</b> | Admin & Data Health | The system shall provide internal controls for source configuration, refresh schedules, and data quality monitoring. |

## 7.1 Prioritization

| Priority           | Included Capabilities                                             |
|--------------------|-------------------------------------------------------------------|
| <b>Must Have</b>   | FR-01 through FR-10, FR-13                                        |
| <b>Should Have</b> | FR-11, FR-12, FR-14                                               |
| <b>Could Have</b>  | FR-15 plus industry-specific templates and collaboration features |

## 8. Non-Functional Requirements

| Category              | Requirement                                                                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Performance</b>    | Initial opportunity summary should be returned within 60 seconds for standard analyses; lighter previews should load in under 5 seconds.         |
| <b>Availability</b>   | Production target of 99.5% monthly uptime for customer-facing services.                                                                          |
| <b>Scalability</b>    | Architecture shall support multi-city and multi-country expansion through modular data connectors and cloud-native services.                     |
| <b>Security</b>       | User data, saved analyses, and API traffic shall be protected using strong authentication, encryption in transit, and role-based access control. |
| <b>Privacy</b>        | Personal data collection shall be minimized and aligned with applicable data-protection laws and geographic requirements.                        |
| <b>Explainability</b> | Each recommendation shall expose score drivers, confidence indicators, and supporting evidence references wherever possible.                     |
| <b>Auditability</b>   | Saved reports shall include timestamps, source assumptions, and model version or dataset version references.                                     |

## 9. Data, AI, and Integration Requirements

### 9.1 Core Data Inputs

- Business listings, category metadata, ratings, and reviews
- Demographic indicators such as population, income, household density, and growth
- Commercial property and rent signals where available
- Mobility, transport, parking, and amenity data
- Urban development indicators including projects, expansion zones, and infrastructure plans
- User-provided assumptions such as budget, preferred sectors, and investment horizon

### 9.2 AI / Analytics Architecture

| Component                           | Purpose                                                     | Expected Output                                                  |
|-------------------------------------|-------------------------------------------------------------|------------------------------------------------------------------|
| <b>Location Intelligence Engine</b> | Compute area quality and suitability                        | Composite area score and feature-level drivers                   |
| <b>Gap Detection Model</b>          | Identify underserved business categories                    | Gap list with fit score and rationale                            |
| <b>Demand Forecasting Model</b>     | Estimate demand and growth potential                        | Forecast ranges and confidence bands                             |
| <b>Recommendation Engine</b>        | Rank opportunities for a given location and profile         | Ordered shortlist with scores and explanations                   |
| <b>LLM Advisory Layer</b>           | Translate quantitative outputs into plain-language guidance | Executive summary, answer generation, and action recommendations |

### 9.3 External Integrations

- Maps, geocoding, routing, and visualization providers
- Commercial or public demographic and business datasets
- Cloud storage, job processing, and observability tooling
- Authentication, billing, and CRM tools for SaaS operations

## 10. Analytics and Success Metrics

| Metric Group             | Metric                                           | Target / Interpretation                               |
|--------------------------|--------------------------------------------------|-------------------------------------------------------|
| <b>Adoption</b>          | Monthly active users                             | Track product-market interest and retention           |
| <b>Activation</b>        | Percentage of users completing first analysis    | Indicates onboarding clarity and speed to value       |
| <b>Quality</b>           | Recommendation acceptance or shortlist save rate | Measures how often users find results worth keeping   |
| <b>Commercial</b>        | Free-to-paid conversion                          | Measures monetization of serious users                |
| <b>Commercial</b>        | Average revenue per account                      | Tracks pricing power and enterprise mix               |
| <b>Trust</b>             | Report export rate and repeat analysis rate      | Signals confidence in outputs and workflow usefulness |
| <b>Model performance</b> | Forecast calibration and explanation feedback    | Used to improve scoring logic and model reliability   |

## 11. Risks, Dependencies, and Assumptions

| Type              | Item                                                                                   | Mitigation                                                                       |
|-------------------|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Risk</b>       | Inconsistent or incomplete data coverage across regions                                | Use modular source strategy, confidence scoring, and transparent coverage labels |
| <b>Risk</b>       | Users may over-trust AI output as guaranteed investment advice                         | Provide disclaimers, evidence layers, and explainability by design               |
| <b>Risk</b>       | Data licensing and infrastructure cost may compress early margins                      | Stage geography rollout and prioritize highest-value datasets                    |
| <b>Dependency</b> | Reliable access to map, business, and demographic data providers                       | Maintain fallback providers and contract review process                          |
| <b>Dependency</b> | Cross-functional coordination between product, data science, and engineering           | Use phased delivery plan and versioned requirement ownership                     |
| <b>Assumption</b> | Users value faster evidence-backed decisions enough to pay recurring subscription fees | Validate with MVP pilots and pricing experiments                                 |

## 12. Roadmap and Delivery Plan

| Phase                               | Scope                                                                                    | Outcome                                                   |
|-------------------------------------|------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| <b>Phase 1 - MVP</b>                | Location search, competitor analysis, opportunity score, AI summary, basic report export | Validate core value proposition and early-user demand     |
| <b>Phase 2 - Intelligence Depth</b> | Gap detection, demand forecasting, revenue estimation, interactive heatmaps              | Improve analytical usefulness and conversion potential    |
| <b>Phase 3 - Decision Support</b>   | AI copilot, investment simulator, risk explanation, multi-location comparison            | Move from insight product to strategic planning assistant |
| <b>Phase 4 - Platform Scale</b>     | Enterprise dashboard, API access, alerts, multi-city rollout, team collaboration         | Establish defensible recurring enterprise value           |

## 13. Acceptance Criteria

- A user can submit a location and receive a structured opportunity ranking with transparent rationale.
- The system can identify existing businesses and provide category-level density insights for the selected area.
- At least one downloadable report format is available for completed analyses.
- Recommendation outputs include investment, demand, and risk views with explicit assumptions or confidence indicators.

- Authenticated users can save and reopen analyses in the MVP production environment.

## 14. Appendices

### 14.1 Source Document Summary

This PRD was derived from the original 'AI Business Opportunity Intelligence Platform' business proposal, which described the market need, solution concept, AI modules, business model, roadmap, and strategic potential. The PRD reorganizes that material into implementation-ready product requirements.

### 14.2 Suggested Next Steps

20. Validate top three user segments through discovery interviews.
21. Define market-entry geography and data coverage strategy.
22. Convert FR-01 to FR-10 into epics, user stories, and acceptance tests.
23. Prototype the scoring framework and competitor-density map workflow.
24. Run a pilot with founders, consultants, or incubator programs to validate willingness to pay.
